1 OVERVIEW

The Laird M.2 development kit provides a platform for rapid wireless connectivity prototyping, providing multiple options for the development of Wi-Fi applications.

This manual is for Rev. 01 of the development PCB and relates to DVK-60-2230C-B0 on the PCB itself. The complete functionality of the development kit hardware requires the use of Laird 50- and 60-series firmware version v xx.xx.xx or greater.

Part number: DVK-60-2230C

Applicable to the following Wi-Fi module part numbers:

<table>

1.1 Introduction

The Laird M.2 development kit is designed to support the rapid development of applications and software for the 50- and 60-series of Wi-Fi modules featuring Laird’s innovative event driven programming language – xxxxxx. More information regarding this product series including a detailed module user guide are available from the 60 Series product page of the Laird website.

1.2 Package Contents

Each kit contains the following:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Development board</td>
<td>The development board has the required 60-2230C module installed onto it and exposes all the various hardware interfaces available.</td>
</tr>
</tbody>
</table>
| Power options              | ▪ USB cable – Type A to micro B. The cable also provides serial communications via the FTDI USB – RS232 converter chip on the development board  
                                  ▪ DC barrel plug with clips for connection to external power supply |
| IDC cable x?               | Supplied to allow simple connection to the ? x ? way pin headers into J20, J21, and J23. The IDC cables are 2.54 mm pitch. |
| SDIO extension cable       | Supplied to allow a simple connection to the SDIO socket                     |
| Web link card              | Provides links to additional information including the 50- and 60-series user guide, schematics, quick start guides, and firmware release notes. |

2 M.2 DEVELOPMENT KIT – MAIN DEVELOPMENT BOARD

This section describes the M.2 development board hardware. The M.2 development board is delivered with the 50- and 60-series modules but no onboard firmware applications.

The M.2 development board is a universal development tool to highlight the capabilities of the 50- and 60-series modules. The development kit is supplied in a default configuration which should be suitable for multiple experimentation options. It also offers a number of pin headers that help to create different configurations for 50- and 60-series modules. This allows you to test different operating scenarios.

The development board allows the 50- and 60-series modules to physically connect to a SDIO host via the supplied SDIO extension cable for development purposes. The development board also provides USB-to-Virtual
COM port conversion through a FTDI chip – part number FT232R. Any Windows PC (XP or later) and Linux PC (Ubuntu xx.xx or Fedora xx.xx) should auto-install the necessary drivers; if your PC cannot locate the drivers, you can download them from http://www.ftdichip.com/Drivers/VCP.htm

2.1 Key Features

The M.2 development board has the following features:

- 50- or 60-series module installed on-board
- Power supply options for powering development board from:
  - USB
  - External DC supply
  - SDIO interface
- Regulated 3.3 V for powering the 50- or 60-series modules. Optional regulated 1.8 V for powering the VCCIO for FTDI chip
- USB-to-UART bridge (FTDI chip)
- USB interface for Wifi or BT
- M.2 UART can be interfaced to:
  - USB (PC) using the USB-UART bridge
  - External UART source (using IO break-out connector when development board powered from DC jack or SDIO interface)
- Current measuring options:
  - Pin header (Ammeter)
- IO break-out (2.54 mm pitch headers) connectors interface for plugging-in external modules and accessing all interfaces of the 50- or 60-series modules [UART, LTE coexistence, PCM, GPIO].
- Three buttons and LEDs for user interaction.
- External 32 KHz oscillator for the sleep clock.
2.2 Understanding the Development Board

Figure 1: Development board
3 FUNCTIONAL BLOCKS

This section covers the major functional blocks that form the development board.

The development board can be powered from a DC 12-volt supply (into DC jack connector CON5), USB (type micro-B connector, USB2/USB3) or the host interface (PCIe or SDIO interface). The power source fed into DC jack is regulated down to 5 volts with an on-board regulator and wire to SW2.

The 5 volts from the USB or the DC jack is regulated down to 3.3 volts with an on-board regulator on the development board. Switch SW2 selects between the regulated 5 volt and USB. The voltage from host interface (PCIe or SDIO interface) is not regulated but is fed directly to M.2 module supply pin.

Default position of SW2 is to select regulated 5 volts.

The development board has a 1.8-volt regulator for the VCCIO of FTDI-Chip.
On the development board, the power domain:

- M2_3V3 supplies the M.2 module only.
- The header connectors (J3, J4, J5) can be used to measure the current of power domain M2_3V3.
- REG_1V8 supplies the FTDI chip IO only.

### 3.3 Tact Switches

The development board has reserved three tact switches to access the PDn, W_Disable1#, WOW and WOBT. To view the location, refer to Figure 1.

#### 3.3.1 PDn (SW6)

Full Power-Down (Input) (Active Low)

0 – Full power-down mode

1 – Normal mode

- PDn can accept an input of 1.8 volts
- PDn may be driven by the host
- PDn must be high for normal operation

An internal pull-up resistor on this pin.

#### 3.3.2 W_Disable1# (SW7)

PCIe host indication to disable the WLAN function of the device (Input) (Active Low)

0 – Disable the WLAN

1 – Normal mode

- W_Disable1# can accept an input of 3.3 volts.
- W_Disable1# may be driven by the host
- W_Disable1# must be high for normal operation

An internal pull-up resistor on this pin.

#### 3.3.3 WOW (SW8)

Easily measured the “Wake on Wireless Lan” signal which generate by M.2 module.
3.3.4 WOBT (SW9)

Easily measured the “Wake on BT” signal which generate by M.2 module.

Note: W_DISABLE1# and PDn were also wired out to J23 for testing. To view its location, refer to Figure 1.

3.4 4-wire UART Serial Interface

The development board provides access to the M.2 module 4-wire UART interface (TX, RX, CTS, RTS) either through USB (via U7 FTDI USB-UART convertor chip) or through a breakout header connector J15, J16, J17 and J18. Refer to Figure 5.

Note: M.2 module provides 4-wire UART interface on the HW. 

\[ V_{hi} \text{ is from 1.26V to 2.2V; } \ V_{li} \text{ is from -0.4V to 0.54V.} \]

3.4.1 UART Mapping

UART connection on the 50 and 60 series modules and FTDI IC are shown in table below. Refer to Figure 5 to see how the 50 and 60 series module UART is mapped to the breakout header connector (J15, J16, J17 and J18).

3.4.2 UART Interface Driven by USB

- **USB Connector** – The development kit provides a USB Type micro-B connector (USB2) which allows connection to any USB host device. The connector optionally supplies power to the development kit and the USB signals are connected to a USB to serial convertor device (FT232R).

- **USB–UART** – The development kit is fitted with a (U7) FTDI FT232R USB to UART convertor which provides USB-to-Virtual COM port on any Windows PC (XP or later). Upon connection, Windows auto-installs the required drivers. For more details and driver downloads, visit [http://www.ftdichip.com/Products/FT232R.htm](http://www.ftdichip.com/Products/FT232R.htm).

- **UART interface driven by USB FTDI chip** – In normal operation, the M.2 UART interface is driven by the FTDI FT232R USB to UART convertor.

3.4.3 UART Interface Driven by External Source

- **UART interface driven by external UART source** – The M.2 module UART interface (TX, RX, CTS, RTS) is presented at a 2.54 mm (0.1 in.) pitch headers (J15, J16, J17 and J18). To allow the M.2 UART interface to be driven from the breakout header connector (J15, J16, J17 and J18):
  - Development board must be powered from DC jack (CON5) and switch SW1 is in position DC JACK 5V.
3.5 32.768 KHz Oscillator

The development kit is fitted with a (U1) 32.768 KHz oscillator which provides sleep clock to M.2 module.

Fit a jumper on J1 to disable the sleep clock, if needed.

3.6 PCM

The development kit provides the PCM signal on J20.

The pin descriptions of J20 for PCM signal are shown in below table.

### 3.7 LTE Coexistence

The development kit provides the LTE coexistence signal on J21.

The pin descriptions of J21 for LTE coexistence signal are shown in below table.

<table>

**Table 7: LED descriptions**
3.9 Micro USB Port (USB3)

The development board provides access to the M.2 module USB2.0 interface (USB_D+ and USB_D-) either through micro USB connector (USB3) or through PCIe golden finger. To view the location, refer to Figure 1.

4 ADDITIONAL DOCUMENTATION

Laird offers a variety of documentation and ancillary information to support our customers through the initial evaluation process and ultimately into mass production. Additional documentation includes:

- DVK-60-2230C - Schematics
- 50 and 60 series M.2 Module – User Manual – Hardware Datasheet and Integration Guide

For any additional questions or queries, or to receive local technical support for this Development Kit or for the 50 and 60 series modules, please contact wirelessinfo@lairdtech.com
