EXHIBIT 7. Antenna Power and EIRP Power Density

Test Engineer:	Khairul Aidi Zainal
Test Date:	7/11/16 – 7/12/16

Requirement:

Article 49.20 of the Ordinance regulating Radio Equipment allows an absolute maximum (including +20% tolerance) antenna power of 3mW/MHz for an FHSS system that occupies the frequency range 2400 to 2483.5 MHz. The maximum EIRP power density allowed is 12.14 dBm/MHz for non-directional antennas and 22.14 dBm/MHz for directional antennas.

Test note:

1. For classic Bluetooth measurement, the EUT was set to hopping mode (79 channels).
2. Measurement performed at nominal, +10% nominal and -10% nominal supply voltage.
3. Hopping settings:
 - a. GFSK
 - b. EDR2
 - c. EDR3
4. Measurement procedure: Wide band power sensor attached to power meter.
 - a. Measured power is then divided by the spreading bandwidth (in MHz)
5. An estimation of the spreading bandwidth was used to determine antenna power for the minimum channel mode of AFH. The minimum channel used in AFH mode is 20:
 - a. Spreading bandwidth (minimum) = [Spreading bandwidth (maximum)/maximum number of channels(80)] * minimum number of channels (20)
 - b. GFSK Example:
Spreading bandwidth (minimum) = [71.8MHz/80]*20
= 18.0 MHz.
Antenna power (minimum channel) = 9.247/18.0 = 0.5152 mW/MHz

Result:

The EUT is compliant to the requirement of the Ordinance regulating Radio Equipment.

Exclusion bands:

In case of the frequency hopping systems and a combination of hopping and other modulation method(s), the range from 2,374 MHz to 2,509.5 MHz is excluded. For other modulation methods, the range from 2,400 MHz to 2,483.5 MHz is excluded.

Test note:

1. EUT was tested at the lowest, middle and high channels.
2. Measurement performed at nominal, +10% nominal and -10% nominal supply voltage.
3. Testing performed across all modulations/modes (GFSK, EDR2, EDR3)

Article 2 of the Ordinance Regulating Radio Equipment states that the EUT shall be constructed in such a way that the RF parts cannot be reached easily by the user

Result:

The radio module, except for the antenna port, is located under a shield.

The EUT is found to be compliant to the requirement of the Ordinance regulating Radio Equipment.

EXHIBIT 17. Voltage fluctuation

Requirement:

Article 15-1 of the Ordinance Regulating Radio Equipment states that all measurements shall be carried out with three different supply voltages: The rated nominal value, -10% and +10%. However if the EUT uses an internal voltage regulator, supplying power to all critical parts of the radio circuitry, it is acceptable to restrict the measurements to the nominal supply voltage value under the condition that the regulator is capable to reduce the voltage variation to a value smaller than 1% of input (if the input is varied by 10%).

Result:

All testing were performed with supply voltage varied at $\pm 10\%$ of the nominal voltage.

EXHIBIT 18. Interference Prevention Function

Requirement:

Article 2 of the Ordinance Regulating Radio Equipment states that the EUT shall have the capability to transmit or to receive the MAC identification automatically, so that sender and receiver shall exclude other equipment.

Result:

Statement from manufacturer:

“The device has a radio module that implements the IEEE 802.11 b/g/n (HT20) protocols, as well as, Bluetooth 2.1 + EDR & 4.0 (BLE) protocols. The module’s 48 bit MAC address is transmitted during the connection phase to a master or peer.”
